Project Title:

Sales Analytics Dashboard based on SAP Order-to-Cash (O2C) Process

Name: Rishabh Raj

Roll Number: 2330329

Branch: Electronics and Computer Science

Course Code: IS30044

Course Name: SAP Data / Analytics Engineer

Institution: KIIT University

Submission Date: *18/04/2026*

1. Introduction

In the field of SAP Data and Analytics Engineering, handling large-scale enterprise data and converting it into meaningful insights is a key responsibility. Organizations rely heavily on analytics tools to monitor business performance and make strategic decisions.

SAP S/4HANA provides integrated data across various modules, and SAP Analytics solutions help transform this data into actionable insights. Among these processes, the Order-to-Cash (O2C) cycle in the SAP SD module plays a critical role in managing sales operations.

This project focuses on designing a Sales Analytics Dashboard using Power BI, inspired by SAP data analytics concepts, to simulate how enterprise-level analytics is performed.

2. Problem Statement

In real-world business environments:

- Large amounts of sales data are generated daily
- Raw data is difficult to interpret without analytics tools
- Decision-making becomes slow without proper visualization

There is a need for a structured analytics system that can process and present sales data in an understandable format.

3. Objective

The objectives of this project are:

- To simulate SAP data analytics workflow
- To design an interactive sales dashboard
- To apply SAP O2C business process concepts
- To provide insights into business performance

4. Scope of the Project

This project focuses on:

- Data analytics and visualization
- SAP SD module concepts
- Simulated SAP S/4HANA data

- Dashboard development using Power BI

The project does not include real SAP system integration due to limited access, but it demonstrates the role of an SAP Data/Analytics Engineer.

5. Role of SAP Data / Analytics Engineer

An SAP Data/Analytics Engineer is responsible for:

- Collecting data from SAP systems (S/4HANA, BW, etc.)
- Transforming and cleaning data
- Designing dashboards and reports
- Providing business insights

This project simulates these responsibilities using Power BI.

6. Methodology / Approach

Step 1: Data Collection

A dataset was created in Excel representing sales transactions.

Step 2: Data Preparation

The dataset included:

- Order ID
- Customer
- Product
- Quantity
- Price
- Date

Step 3: Data Import

The dataset was imported into Power BI.

Step 4: Data Modeling

Measures created:

- Total Sales
- Total Orders

Step 5: Data Visualization

Visuals used:

- Bar Chart
- Line Chart
- Pie Chart
- KPI Cards
- Slicers

Step 6: Analysis

The dashboard provides insights into:

- Sales performance
- Customer trends
- Product demand

7. SAP Concept Used

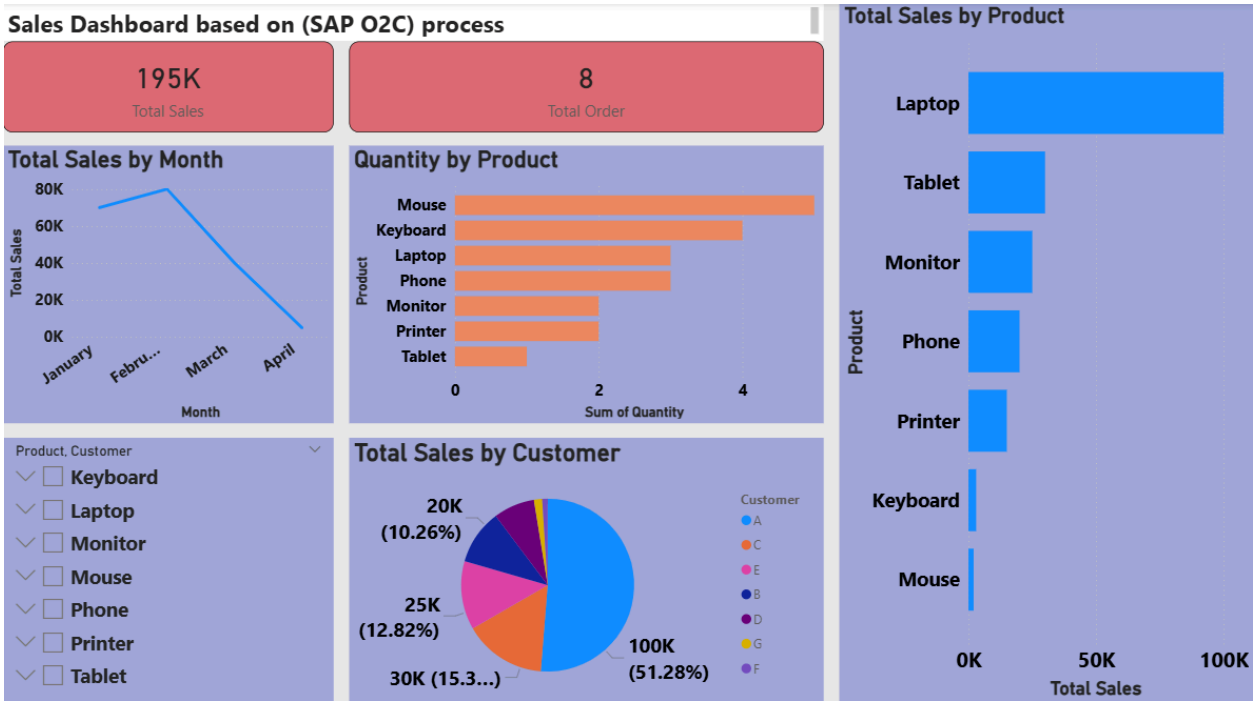
This project is based on:

- **SAP S/4HANA**
- **SAP SD (Sales & Distribution)**
- **Order-to-Cash (O2C) Process**

Customer → Sales Order → Delivery → Billing → Payment

Project	**SAP**
OrderID	Sales Order
Customer	Customer Master
Product	Material
Sales Data	SAP SD Data

Screenshot:



8. Features of the Dashboard

- KPI indicators (Total Sales, Orders)
- Monthly sales trend analysis
- Product-wise sales performance

- Customer-wise contribution
- Interactive filtering system

9. Tools and Technologies Used

- Power BI Desktop
- Microsoft Excel
- SAP Concepts (S/4HANA, SD, O2C)

10. SAP Implementation Note

Due to limited access to SAP GUI and enterprise systems, the project uses simulated data while implementing SAP concepts. The dashboard represents functionality similar to SAP Analytics Cloud.

11. Results and Insights

- Identifying high-performing products
- Understanding customer contribution
- Analyzing monthly sales trends
- Supporting business decisions

12. Advantages

- Simplifies complex data
- Enhances decision-making
- Demonstrates SAP analytics workflow
- Easy to use and interactive

13. Limitations

- No real-time SAP data
- Limited dataset
- No backend SAP integration

14. Future Scope

- Integration with SAP S/4HANA
- Use of SAP Analytics Cloud (SAC)
- Real-time dashboards
- Advanced analytics

15. Conclusion

This project demonstrates how SAP data analytics concepts can be applied to build a practical sales dashboard. It reflects the role of an SAP Data/Analytics Engineer in transforming business data into meaningful insights using analytical tools.
